Vol. 15, No. 29
WEEKLY
REPORT

Week Ending July 23, 1966

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE PUBLIC HEALTH SERVICE

CURRENT TRENDS

EXCESS MORTALITY RELATED TO HEAT WAVE

Excess mortality coincident with unusually high temperatures has been observed in the Middle Atlantic and West North Central Divisions. A similar occurrence was noted in the Middle Atlantic States in 1964 (MMWR, Vol. 12, No. 28).

Figure 1 shows the recent increase in total mortality above the expected level among 122 reporting cities. This began in the 27th week and has extended through the current (29th) week. The excess has been largely in persons 65 years of age and older; the under one-year age group has not been affected. In addition to the increase in total deaths there was also an increase in deaths attributed to pneumonia and influenza.

Advisory Committee on Immunity on Practices –

Typhola artine and Paratyphola Gold B Vaccines 247

The recess in total mortality first appeared in the Middle Atlantic Rivision in the 94th week and one week later in the less North Contra Division. In the current (29th) week mortality returned to the expected level in the Middle Atlantic area but continued high in the West North Central States.

Figure 1
MORTALITY IN 122 UNITED STATES CITIES

RECOMMENDATIONS OF THE PUBLIC HEALTH SERVICE ADVISORY COMMITTEE ON IMMUNIZATION PRACTICES

The Public Health Service Advisory Committee on Immunization Practices meeting on May 16, 1966, is sued the following recommendations on typhoid and paratyphoid A and B vaccines.

TYPHOID VACCINE

The incidence of typhoid fever in the United States has declined steadily for many years. At the present time, less than 500 cases are reported annually, and a continuing downward trend can be expected. Cases are sporadic and are primarily related to contact with carriers rather than to common source exposure. Recognizing this epidemiologic pattern of typhoid fever, re-definition of the role and use of typhoid vaccine is indicated.

Current Status of Typhoid Vaccine

Although typhoid vaccines have been employed for many decades, definitive evidence of their effectiveness has been accumulated only recently from well controlled field investigations. Several different preparations of typhoid vaccine have been shown to afford protection in approximately 70 to 90 percent of individuals immunized, depending in part on the degree of their subsequent exposure⁽¹⁾.

Recommendations for Vaccine Use

Routine typhoid immunization is not recommended in the United States. Selective immunization is, however, indicated in the following situations:

- Intimate exposure to a known typhoid carrier as would occur with continued household contact.
- Community or institutional outbreaks of typhoid fever.
- Foreign travel to areas where typhoid fever is endemic.

Although typhoid vaccine has been suggested for individuals attending summer camps and those in areas where flooding has occurred, there are no data to support the continuation of these practices.

Reference:

(1)Cvjetanovic, B. and Uemura, K., The present status of field and laboratory studies of typhoid and paratyphoid vaccine. Bull WHO 32:29-36, 1965.

Dosage and Schedule

On the basis of the field trials referred to above, the following dosages are recommended, employing the vaccines available in the USA:

Primary Immunization

Adults and children over 10 years

0.5 ml. subcutaneously on two occasions, separated by four or more weeks

Children 6 months to 10 years*

 $0.25\,$ ml. subcutaneously on two occasions, separated by four or more weeks

In instances where there is insufficient time for the two doses to be administered at the time intervals specified, three doses of the same volume listed above may be given at weekly intervals.

Boaster Immunization

Under conditions of continued or repeated exposure a booster dose should be given at least every threyears. Even if an interval greater than three years ha elapsed since the prior immunization, a single booster injection should be sufficient.

The following alternative routes and dosages of booster immunization can be expected to give comparable antibody responses; generally less reaction follows the intradermal route.

Adults and Children over 10 years

0.5 ml. subcutaneously or 0.1 ml. intradermally Children 6 months to 10 years*

0.25 ml. subcutaneously or 0.1 ml. intradermally

PARATYPHOID A AND B VACCINES

The effectiveness of paratyphoid A vaccine has never been established, and recent field trials have shown that available paratyphoid B vaccines were ineffective. In view of these data and recognizing that the paratyphoid A and B antigens when combined with typhoid vaccine may increase the occurrence of vaccine reactions, use of paratyphoid A and B vaccines is not recommended.

^{*}Since febrile reaction in this age group are common following typhoid vaccination, an antipyretic may be indicated.

CURRENT TRENDS EXCESS MORTALITY RELATED TO HEAT WAVE

(Continued from page 246)

Tables 1 and 2 show the extent of excess total mortality by age group in the Middle Atlantic and West North Central Divisions, respectively. They also show percent increases in pneumonia and influenza deaths in these areas. There was a moderate increase over the expected number of total deaths among those 1-64 years of age, and a larger increase (35 and 47 percent for the respective divisions) in those 65 and older.

Table 1 Summary of Reported Deaths in Middle Atlantic Division for Two-Week Period Ending July 16, 1966

| | D | eaths Due | Pneumonia | | |
|-------------------|-----|-----------|--------------|-------------|-------------------------|
| | < 1 | 1-64 | 65 & Over | All Ages | and Influenza Deaths |
| Observed | 321 | 2,604 | 5,001 | 7,926 | 424 |
| Expected | 342 | 2,331 | 3,701 | 6,375 | 227 |
| Excess | -21 | 273 | 1,300 | 1,551 | 197 |
| Excess as Percent | | | | | |
| of Expected | - 6 | 12 | 35 | 24 | 87 |

Table 2
Summary of Reported Deaths in West North Central
Division for Two-Week Period Ending July 23, 1966

| | De | eaths Due | Pneumonia | | |
|-------------------|-----|-----------|--------------|-------------|-------------------------|
| | < 1 | 1-64 | 65 & Over | All Ages | and Influenza Deaths |
| Observed | 83 | 734 | 1,491 | 2,308 | 82 |
| Expected | 86 | 541 | 1,012 | 1,639 | 55 |
| Excess | - 3 | 193 | 479 | 669 | 27 |
| Excess as Percent | | | | | |
| of Expected | ~ 3 | 36 | 47 | 41 | 49 |

New York City in the Middle Atlantic States and St. Louis, Missouri, in the West North Central States contributed the substantial proportion of excess deaths in their divisions. THE MDRBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULA-TION OF 15,600, IS PUBLISHED AT THE COMMUNICABLE DISEASE CENTER, ATLANTA GEORGIA

CHIEF, COMMUNICABLE DISEASE CENTER CHIEF, EPIDEMIDLOGY BRANCH ACTING CHIEF, STATISTICS SECTION DAVID J SENCER, M.D. A.D. LANGMUIR, M.D. IDA L. SHERMAN, M.S.
